# Your goal is the same as always!

## Good Software, Quickly and at Low Cost!

# What it takes

---

## Quickly

Competent & Motivated People

---

## Low Cost

Large Scale Reuse of Components

---

## Good Software

Useful

Extensible

Reliable

---

What they don't  
teach you about  
software at school

# One major obstacle...we are a fashion industry

## Software Development is driven by fashions and fads

- Fifteen years ago it was all about OO
- Ten years ago it was about components, UML, Unified Process
- Five years ago it was about RUP and CMMI
- Two years ago it was about XP
- Today it is about Scrum

All good, but none is all you need

The software industry keeps looking for a silver bullet

# One major obstacle...we are a fashion industry

Yes, Software Development is driven by fashions and fads

- Fifteen years ago it was all about OO
- Ten years ago it was about components, UML, Unified Process
- Five years ago it was about RUP and CMMI
- Two years ago it was about Agile
- Today it is about DevOps

All good, but we are a fashion industry

**There is no silver bullet!**

**This is unsmart!**

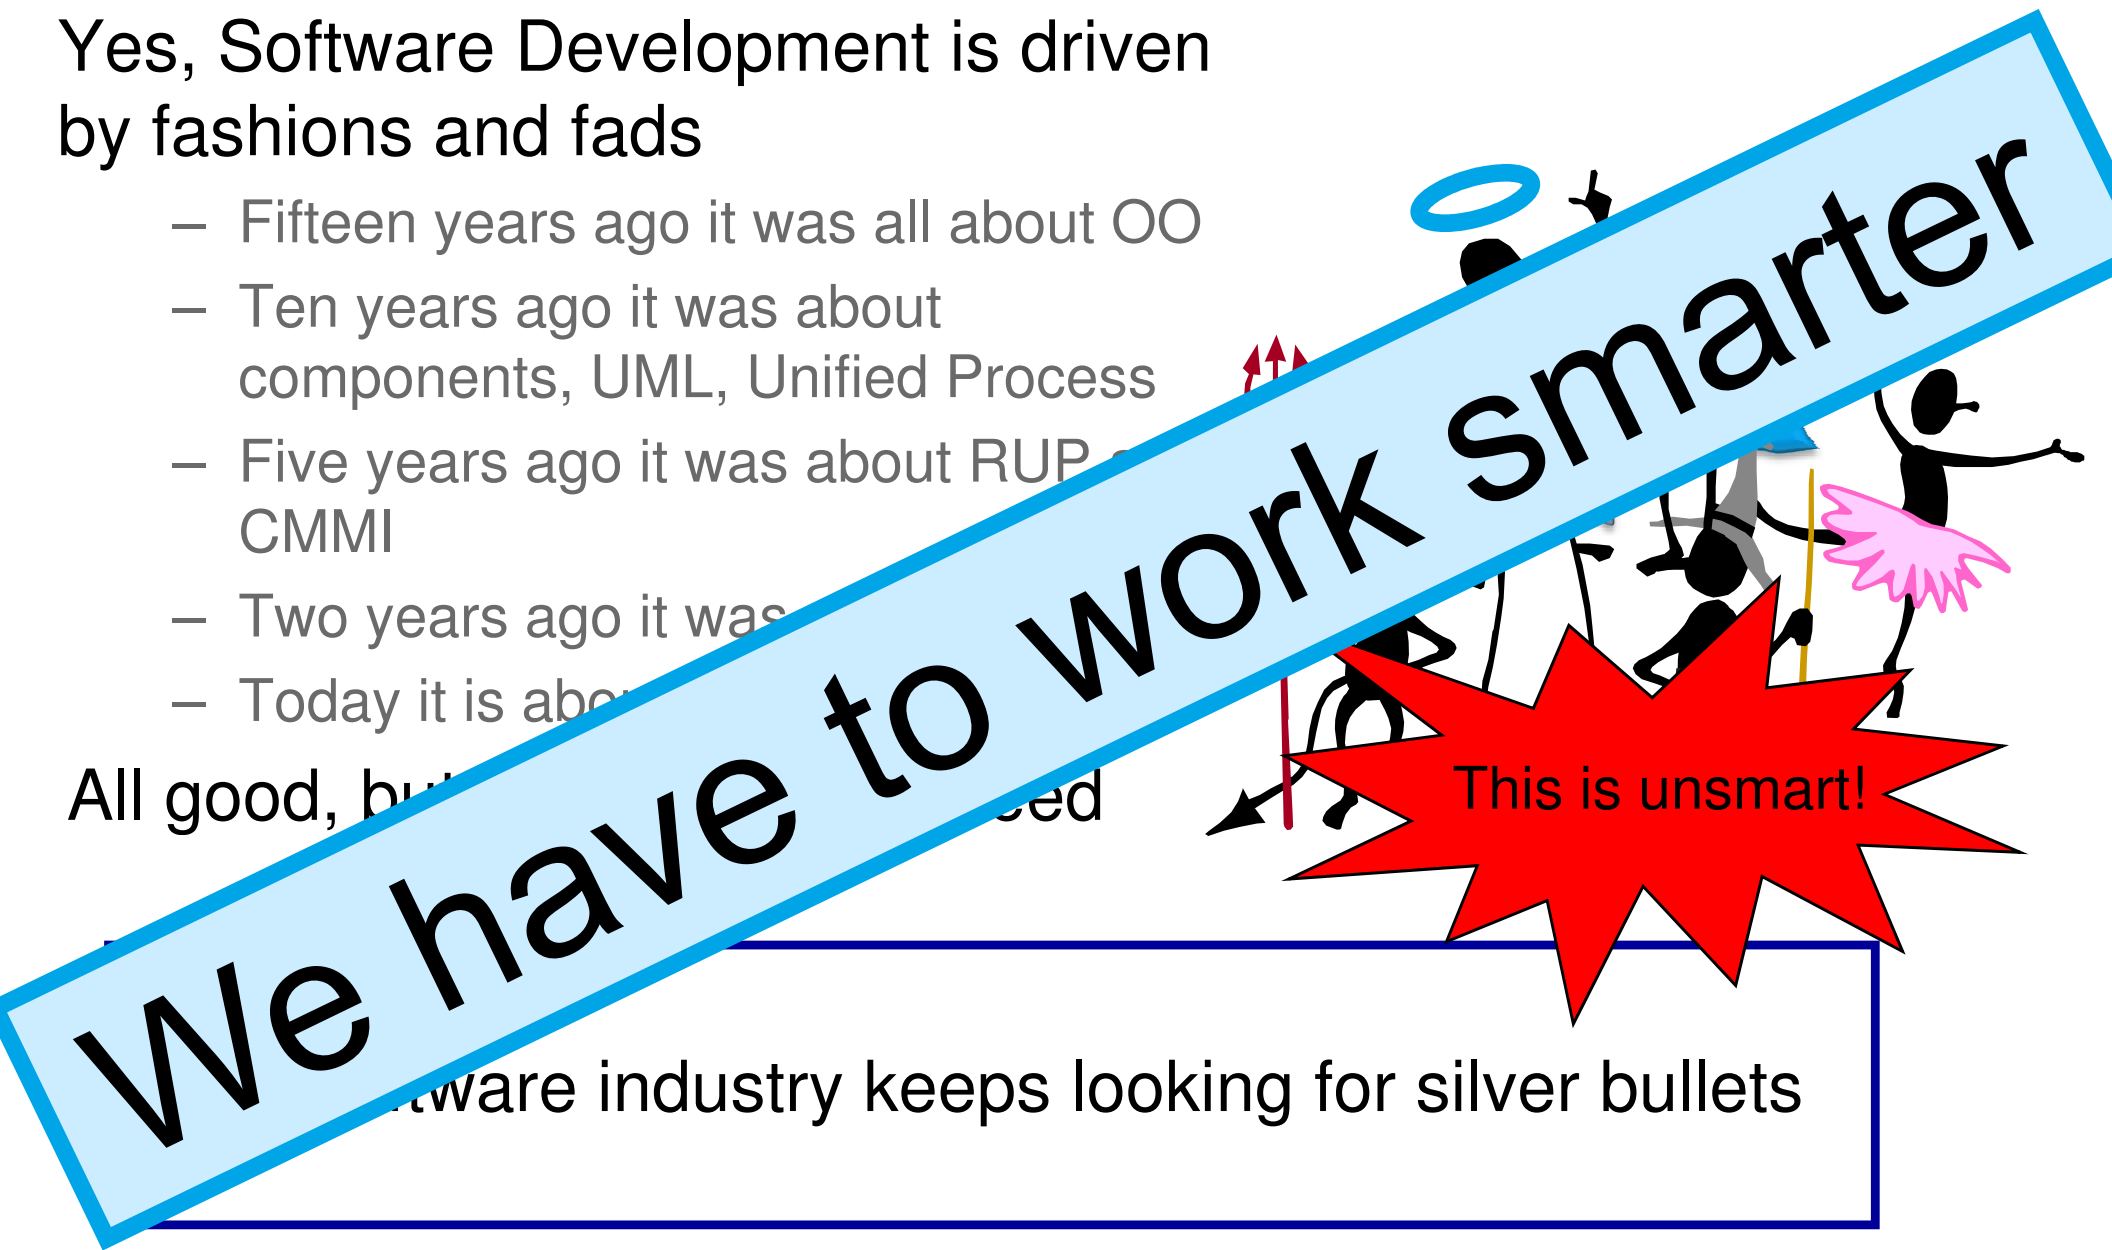

Software industry keeps looking for silver bullets

# One major obstacle...we are a fashion industry

Yes, Software Development is driven by fashions and fads

- Fifteen years ago it was all about OO
- Ten years ago it was about components, UML, Unified Process
- Five years ago it was about RUP and CMMI
- Two years ago it was about Agile
- Today it is about DevOps

All good, but we are still chasing the wind

Software industry keeps looking for silver bullets

# Agenda

1.  What does Smart mean?
2. Smart Cases – Recognize it when you see it
3. How do you become Smart
4. What does Smart really mean?

# What does *Smart* mean?

Things should be done  
as simple as possible – but no simpler  
- *Albert Einstein*

# Smart and Intelligent?

- Being Smart is not the same thing as being intelligent
  - You can be intelligent without being smart, and
  - You can be very smart without being very intelligent

Mr Smart

# Smart and Agile?

- Being Smart is an *evolution* of Being Agile
  - Agile means being flexible and adaptable.
  - Agile provide simple/lightweight starting points
  - But being smart is knowing when to go beyond agile
    - Knowing when to follow the rules and when to break them
    - Knowing when to be consistent and when to change
    - Knowing when to grow and when to shrink

Mr Smart

Smart = Agile ++

# Agenda

1. What does Smart mean?

2. Smart Cases – Recognize it when you see it

1. People
2. Teams
3. Projects
4. Requirements
5. Architecture
6. Modeling
7. Test
8. Documentation
9. Process
10. Knowledge
11. Outsourcing
12. Tools

What they don't  
teach you  
about software  
at school

3. How do you become Smart

4. What does Smart really mean?

[www.ivarblog.com](http://www.ivarblog.com)

# Not smart with People

Some companies view process and tools as more important than people

A fool with a tool is still a fool but a **dangerous** fool

## Case study: Ericsson AXE – the largest commercial success story ever in Sweden

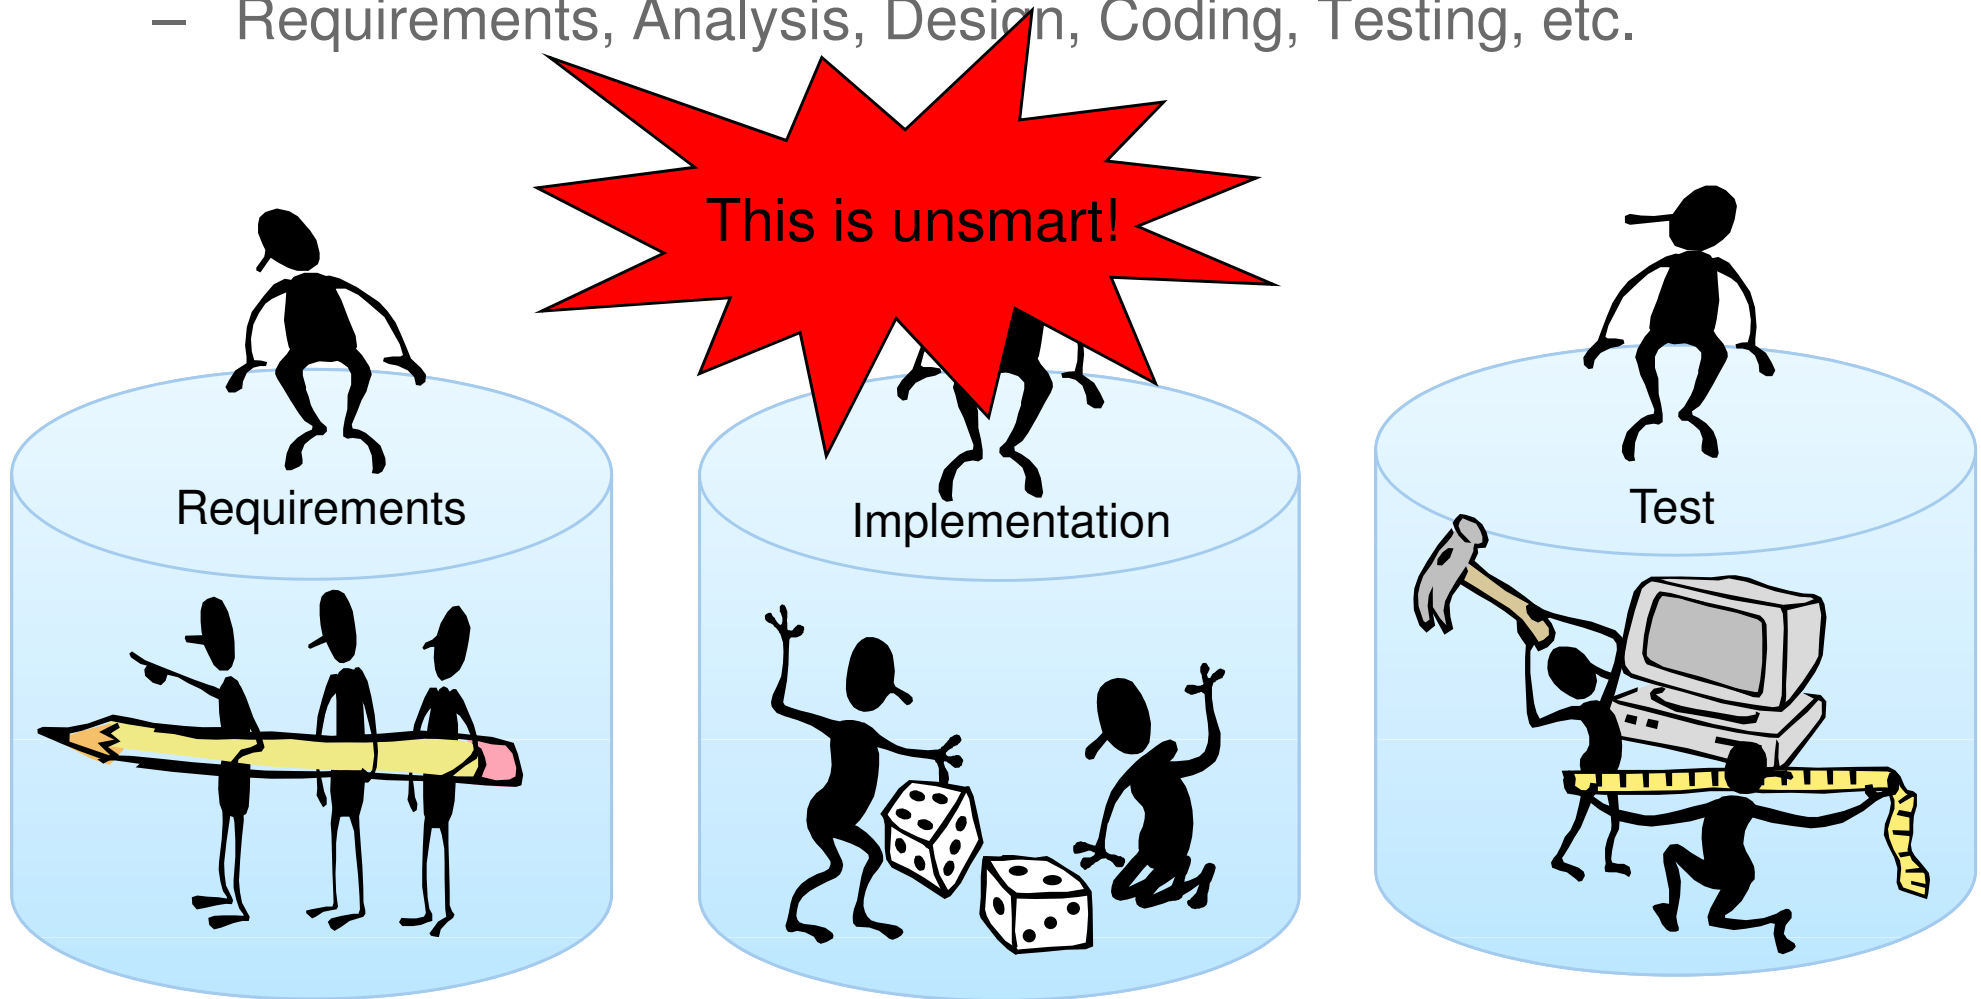

- We had no tools and no defined process
- Despite this, we developed components, use cases, and a modeling language now part of UML
- This could only have been done with people – good people

Software is developed by people,  
not by process and tools.

# Not smart with Teams

- Many software projects involve 20+ people
- Often organized into stove-pipe groups:
  - Requirements, Analysis, Design, Coding, Testing, etc.

# Smart with Teams

- Teams are cross-functional  
Including analysts, developers, testers etc...
- Ideal size of the team is less than 10 people

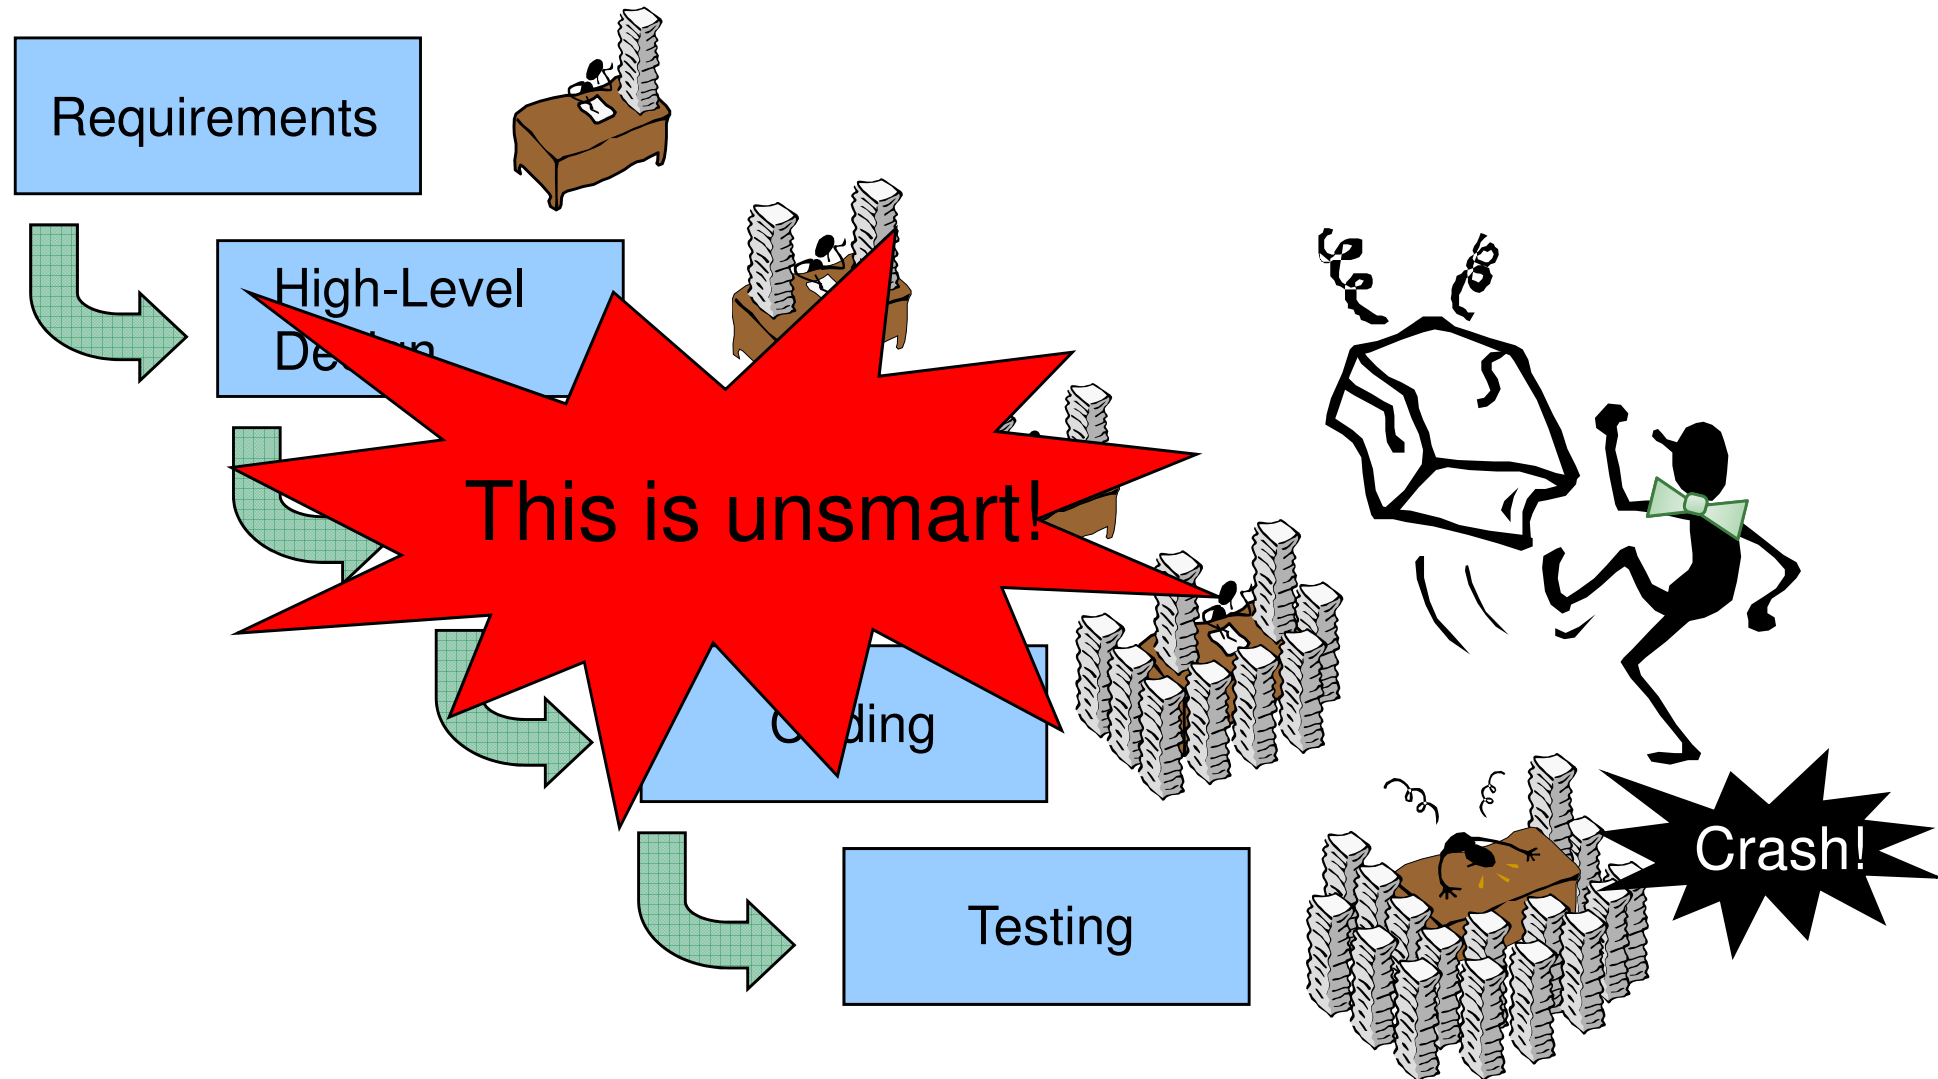

A software team is like a sport team with all needed competencies to win.

# Not smart with Projects

- Most companies still follow the waterfall approach

# Smart with Projects

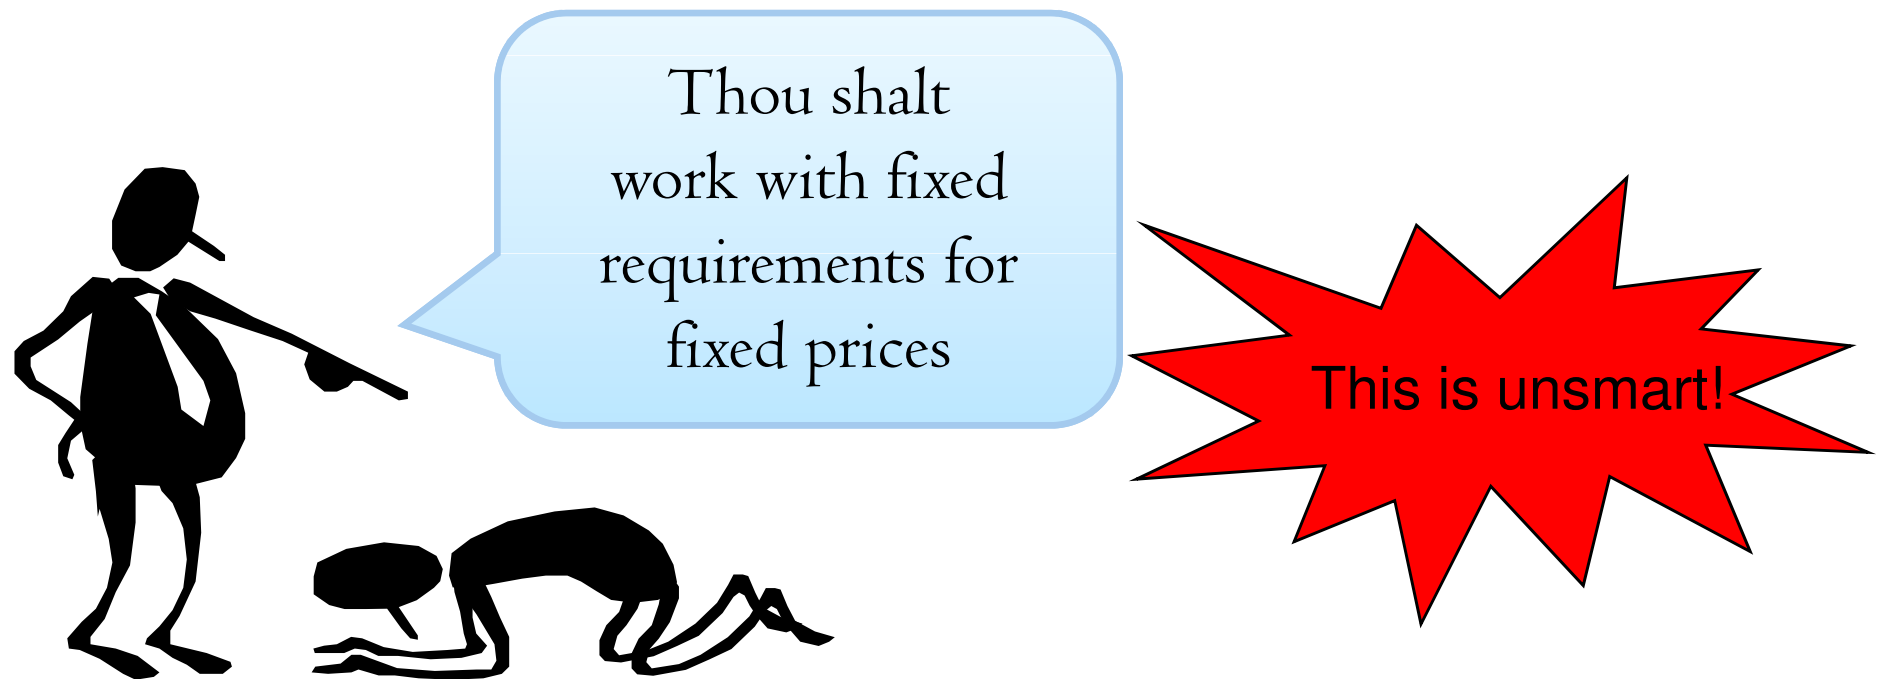

- Build a skinny system to demonstrate that you have eliminated all critical risks
- Add more capabilities on top of that skinny system

Think big, build in many steps

# Not smart with Requirements

- Many managers (and customers) believe you can detail all the requirements upfront...
- ...and based on these can accurately predict the cost of the solution

A constant in software development is that requirements **always** change

# Smart with Requirements

- Base early decisions on lightweight requirements and detail as and when it is needed
  - Use case outlines, feature lists or user stories
- Remember requirements are negotiable and priorities will change

I understand your needs, let's work together to make sure we develop the right system for the right price.

This is smart!

Design your project for requirement changes

# Not smart with Architecture

Two extremes:

No architecture  
Just Code  
Refactor later

This is unsmart!

Mr Supposedly Agile

The single most important determinant of a software system's quality is the quality of its architecture

Mr Enterprise Architect on Ivory Tower

I'll design everything up front

# Smart with Architecture

- Focus on the skinny system
- But an architecture without executable code is a hallucination
- Refactor over releases, but large refactoring is very costly

Skinny System

Full Fledged System

Architectural  
Blue Print

Start to build a skinny system,  
add muscles in later steps

This is  
smart!

# Not smart with Test

*We have two classes of people: Developers and Testers*

- Developers are the creators...it is OK to create bugs as well*
- Testers are the cleaners in the software world*

Testing is done as an after thought – too late and too expensive

We are all testers !

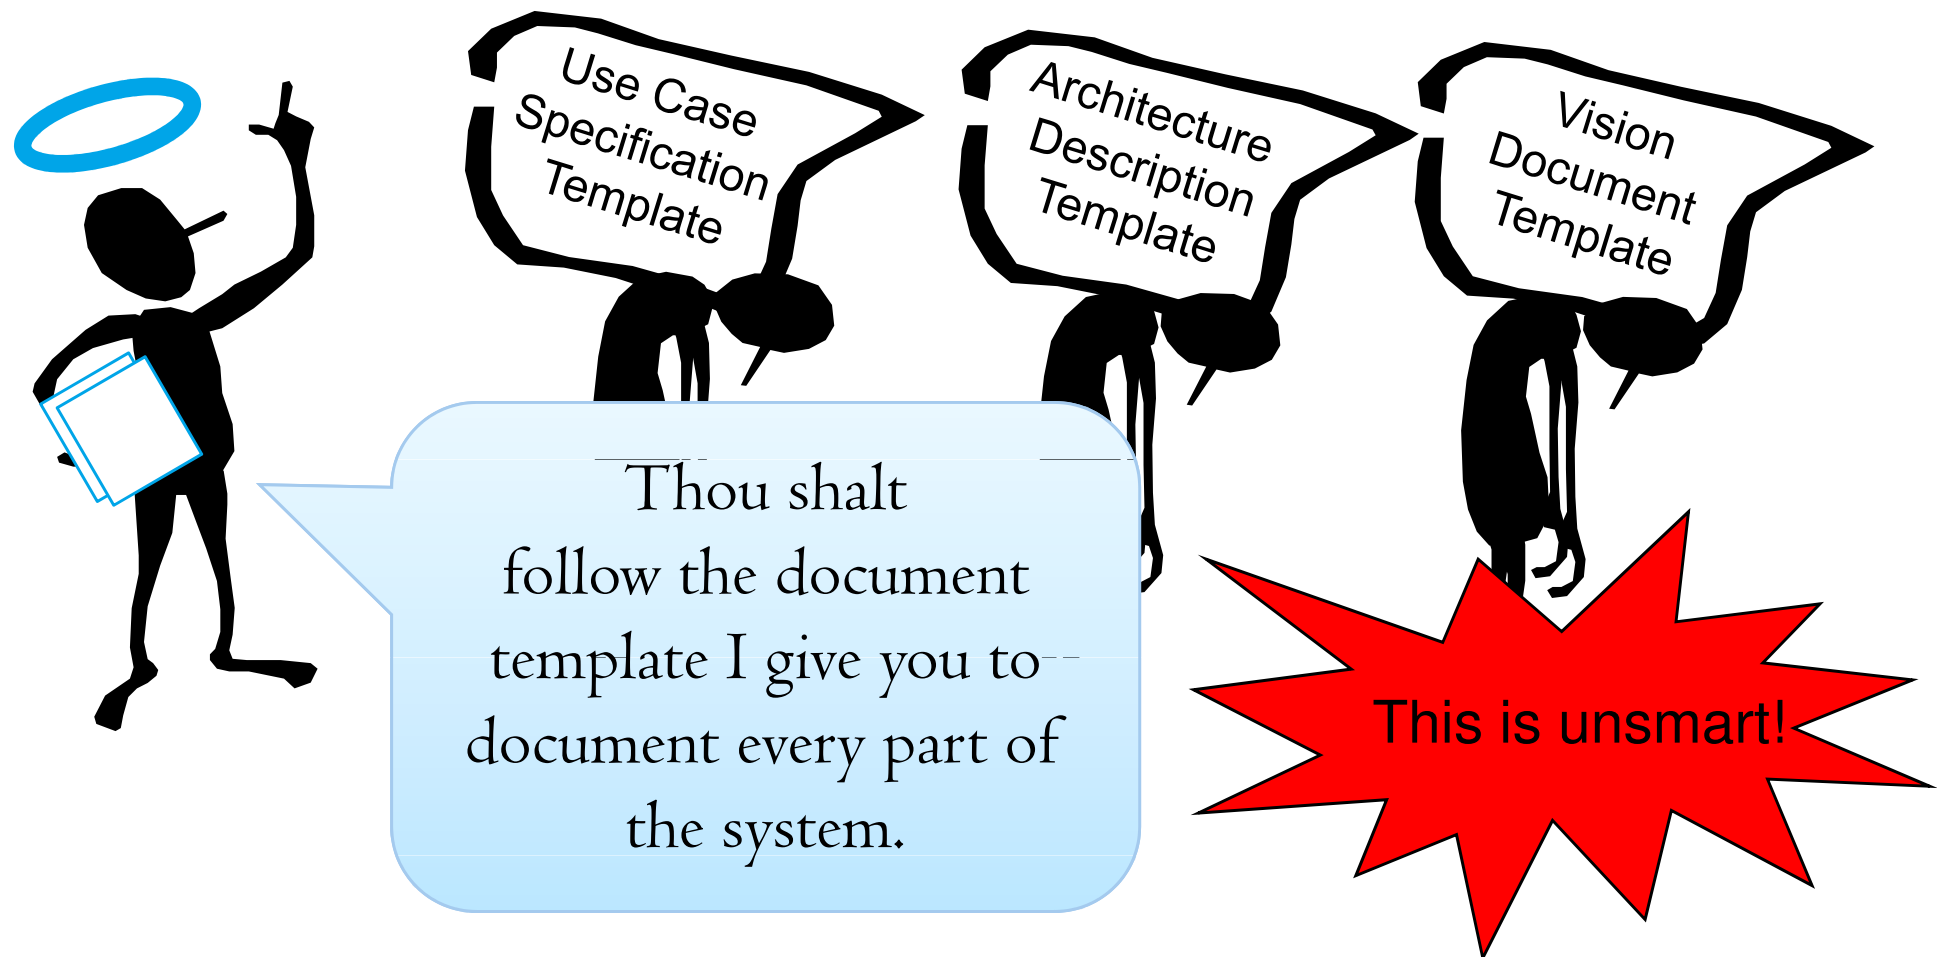

This is  
smart!

Whatever you do **you** are not done  
until **you** have verified  
that **you** did what **you** wanted to do

# Not smart with Documentation

- There has been an over-emphasis on teams producing documentation

# Smart with Documentation

*Myth: The idea that you document software so people later can read what you did.*

- Law of nature: People don't read documents

Focus on the essentials - the placeholders for conversations – people figure out the rest themselves

# Not smart with Process/Methodology/Approach

**Project  
Lead**

# Not smart with Process/Methodology/Approach

Agile

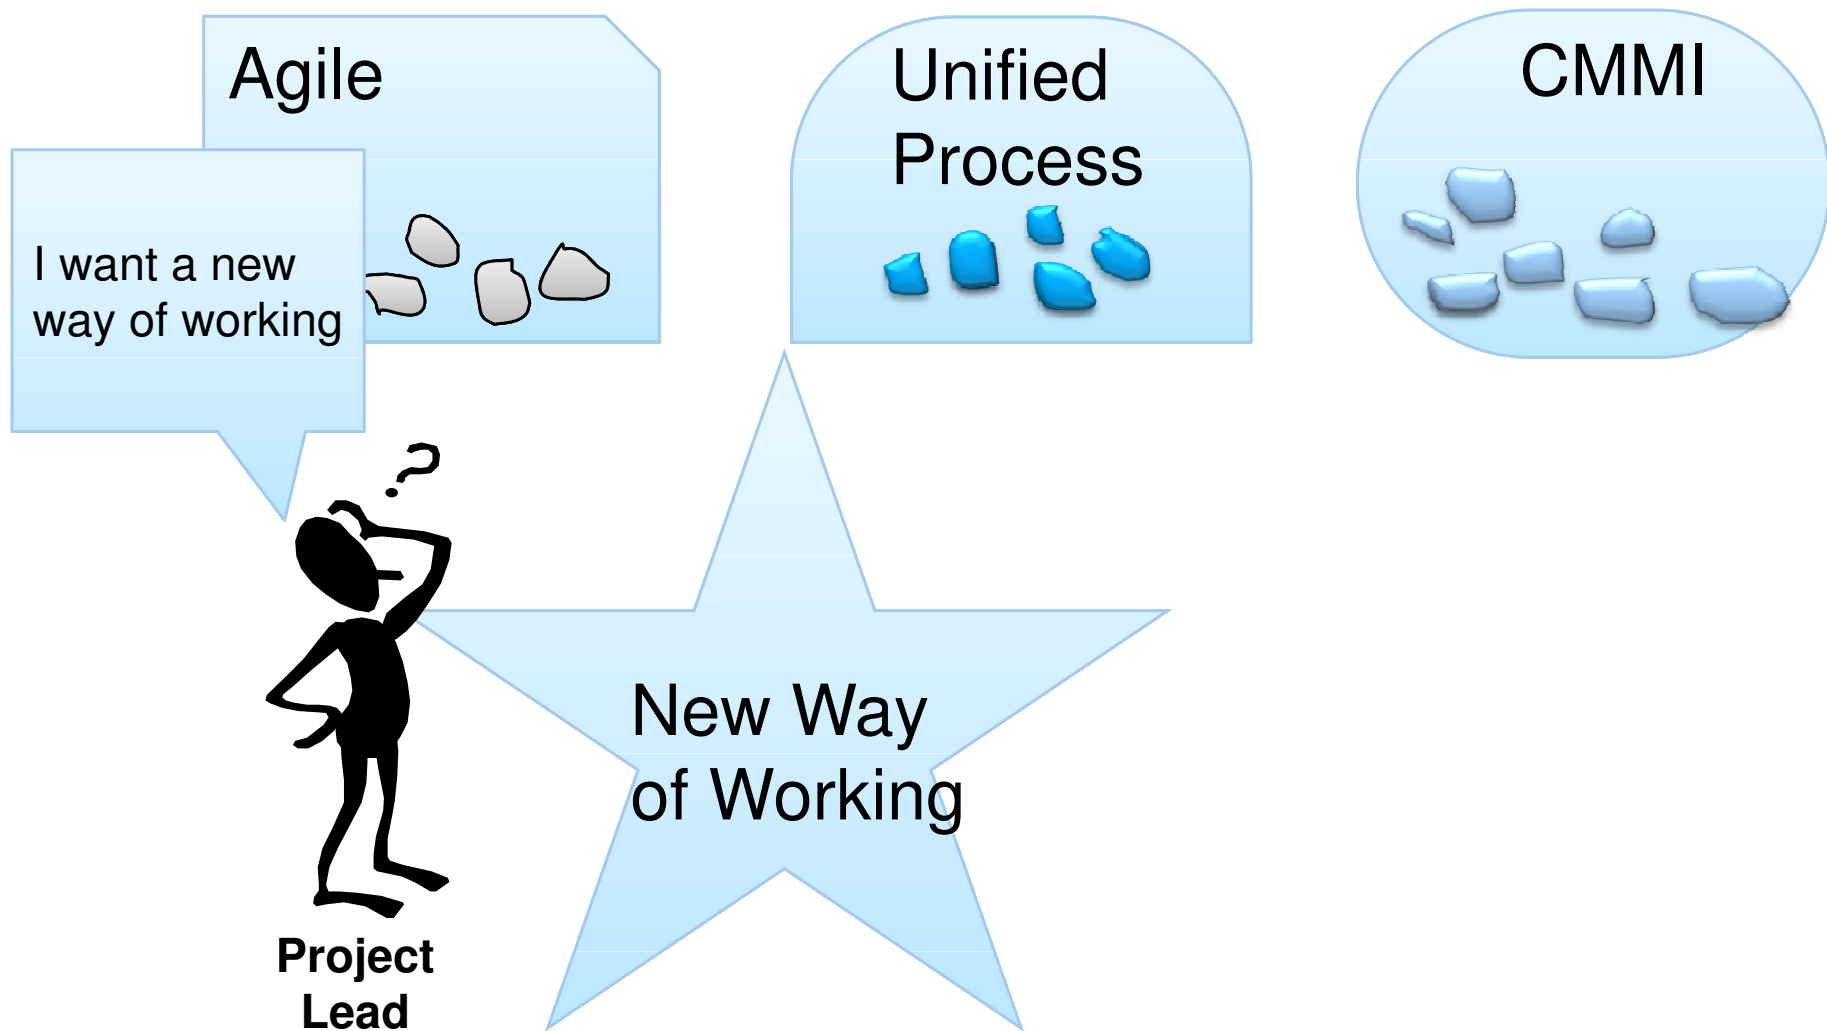

Unified  
Process

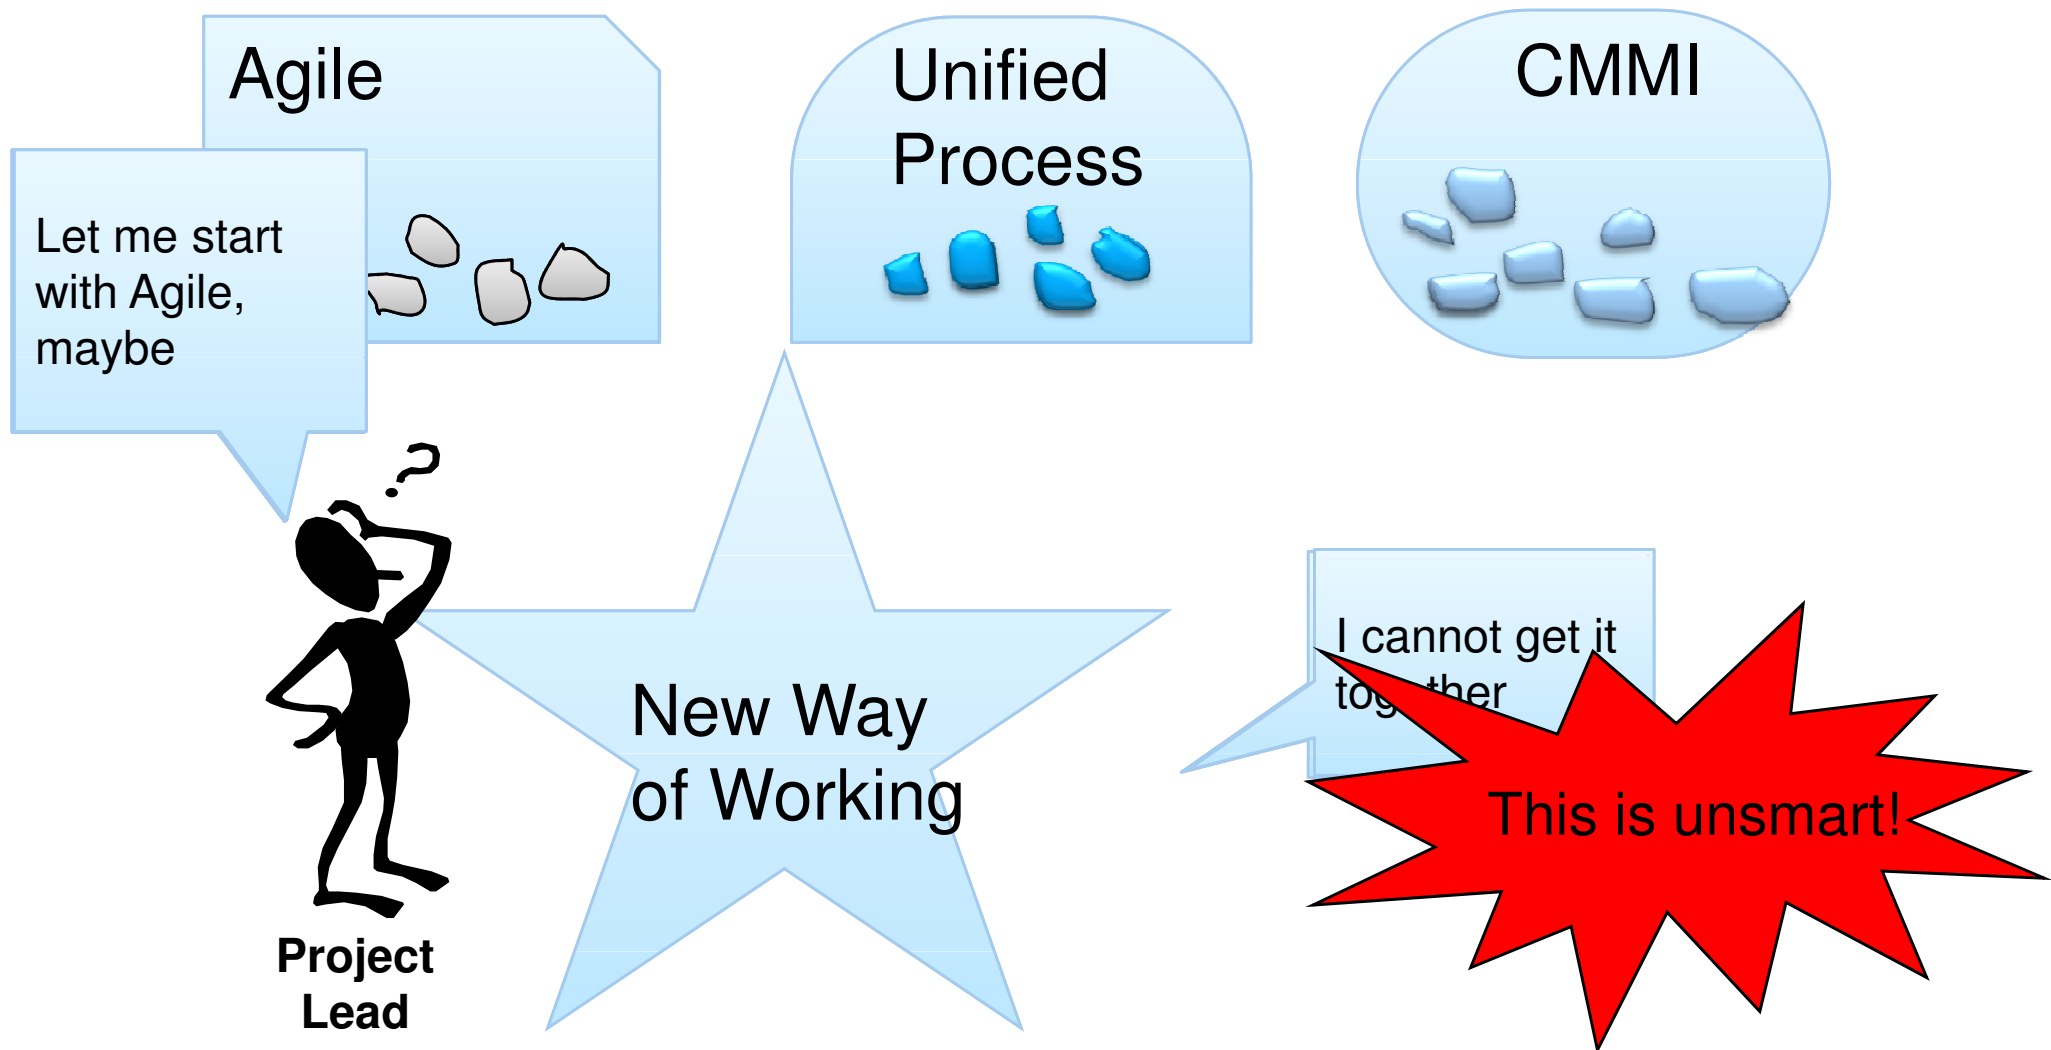

CMMI

# Not smart with Process/Methodology/Approach

*We have got enough of process*

Don't throw out your baby with the bathwater:

1. start from your existing way of working,
2. find your pain points, and
3. change one practice at the time.

# Smart with Process/Methodology/Approach

*And the Law of Nature: People don't read process books  
So focus on the essentials, people figure out the rest  
themselves*

Don't throw away your baby with the bathwater:

1. start from your existing way of working,
2. find your pain points, and
3. change one practice at the time.

# Agenda

1. What does Smart mean?
2. Smart Cases – Recognize it when you see it
3. How do you become Smart
4. What does Smart really mean?

# Summary: Key Elements to Smart Cases

- **People:** Software is developed by people, not by process and tools.
- **Teams:** A software team is like a sport team with all needed competencies to win.
- **Project:** Think big, build in many steps.
- **Requirements:** Design your project for requirement changes.
- **Architecture:** Start to build a skinny system, add muscles in later steps.
- **Modeling:** Don't duplicate the effort by modeling everything
- **Testing:** Whatever you do you are not done until you have verified what you wanted to do.
- **Documentation:** Focus on the essentials - the placeholders for conversations – people figure out the rest themselves
- **Process:** Don't throw away your baby with the bathwater:
  1. start from your existing way of working,
  2. find your pain points, and
  3. change one practice at the time.

# How do you become Smart?

- You need knowledge in *good* (maybe best) practices
  - There are 100's of practices, some of them are good

Business  
Modeling

Test-Driven  
Development

Scrum

Product-Line  
Engineering

Risk-Driven  
Iterative  
Development

Systems  
Engineering

Aspect  
Orientation

Robustness  
Analysis

Retro-  
spectives

Business Process  
Re-Engineering

Use-Case  
Driven  
Development

Pair  
Programming

PSP

User Stories

SOA

Prince2

Use-Case  
Modeling

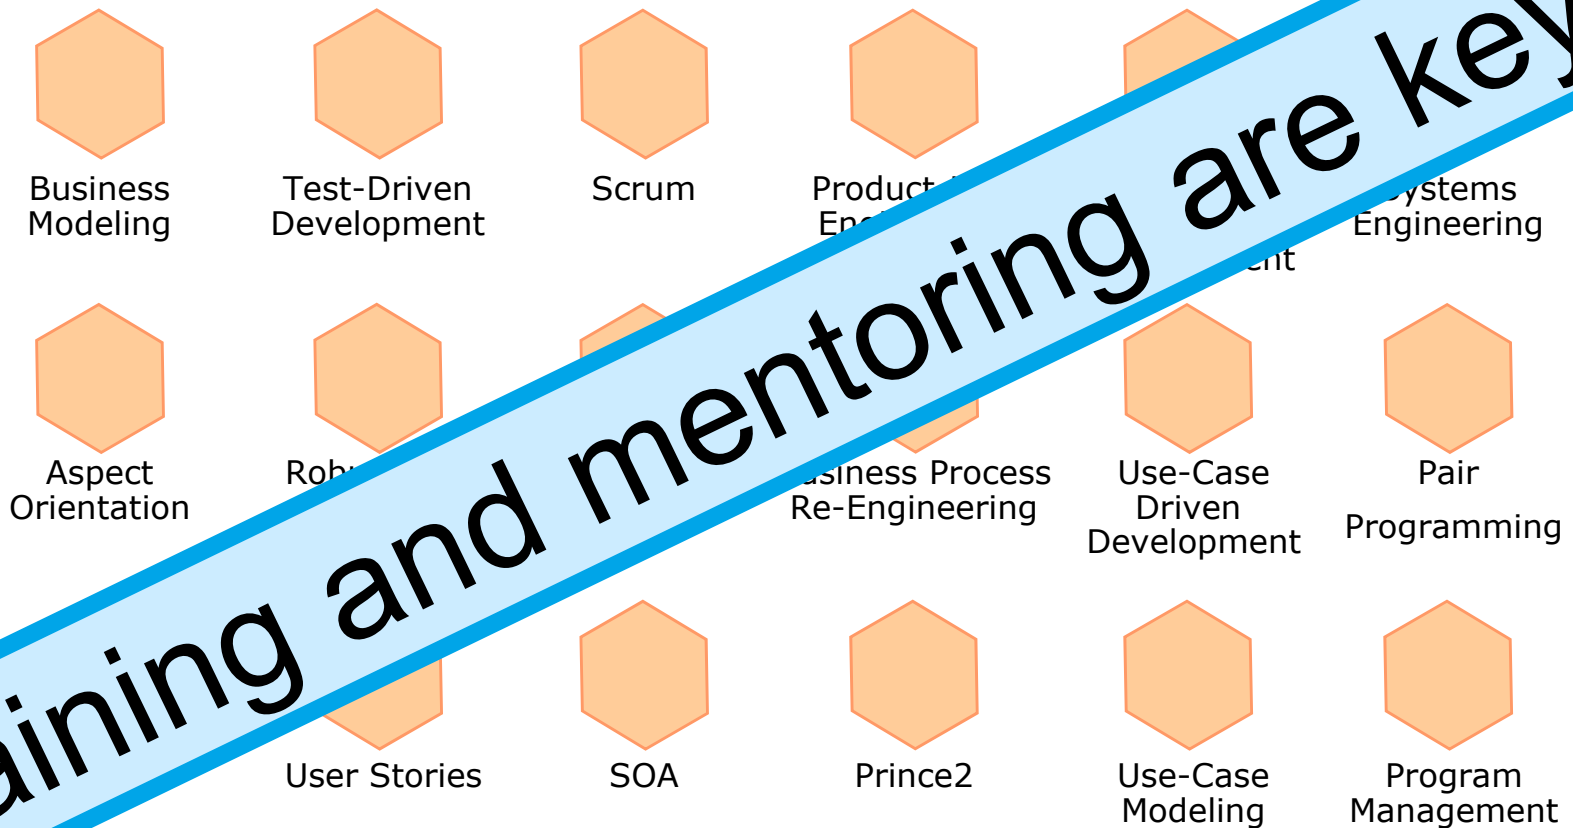

Program  
Management

- And you need experience in using them

# How do you become Smart?

- You need knowledge in *good* (maybe best) practices
  - There are 100's of practices, some of them are good

- And you need experience in using them

# How do you become Smart?

- You need knowledge in *good* (maybe best) practices
  - There are 100's of practices, some of them are good

Business Modeling

Test-Driven Development

Scrum

Asynchronous

Agile

SOA

Prince2

Use-Case Driven Development

Pair Programming

es

SOA

Prince2

Use-Case Modeling

Program Management

... and you know where to get it, right?

- You need experience in using them

# Agenda

1. What does Smart mean?
2. Smart Cases – Recognize it when you see it
3. How do you become Smart
4. What does Smart really mean?

# What does Smart really mean?

- If you didn't get what smart is so far let me summarize it to you

Of course, eventually it comes back to you, but

**We can all  
become  
smarter.**
